### Kernelized linear models

Consider a linear model  $y(\mathbf{x}; \mathbf{w}) = \mathbf{w}^T \mathbf{x}$  with dataset  $D = \{(\mathbf{x}_n, t_n)_{n=1}^N\}$ 

Minimize 
$$J(\mathbf{w}) = (\mathbf{t} - \mathbf{X}\mathbf{w})^T (\mathbf{t} - \mathbf{X}\mathbf{w}) + \lambda \|\mathbf{w}\|^2$$

$$\mathbf{X} = \begin{bmatrix} \mathbf{x}_1^T \\ \vdots \\ \mathbf{x}_N^T \end{bmatrix}$$
 design matrix,  $\mathbf{t} = \begin{bmatrix} t_1 \\ \vdots \\ t_N \end{bmatrix}$  output vector

Luca locchi 9. Kernel Methods 4 / 25

### Kernelized linear models

Optimal solution

$$\mathbf{w}^* = (\mathbf{X}^T\mathbf{X} + \lambda I_N)^{-1}\mathbf{X}^T\mathbf{t} = \mathbf{X}^T(\mathbf{X}\mathbf{X}^T + \lambda I_N)^{-1}\mathbf{t}$$

$$\mathbf{w}^* = \frac{1}{\lambda} \sum_{n=1}^{N} (\mathbf{w}^T \mathbf{x}_n - t_n) \mathbf{x}_n$$

Let 
$$\alpha = (\mathbf{X}\mathbf{X}^T + \lambda I_N)^{-1}\mathbf{t}$$
,  $\alpha_n = \frac{1}{\lambda}(\mathbf{w}^T\mathbf{x}_n - t_n)$ 

Then

$$\mathbf{w}^* = \mathbf{X}^T \boldsymbol{\alpha} = \sum_{n=1}^N \alpha_n \mathbf{x}_n$$

### Kernelized linear models

Hence we have

$$y(\mathbf{x}; \mathbf{w}^*) = \mathbf{w}^{*T} \mathbf{x} = \sum_{n=1}^{N} \alpha_n \mathbf{x}_n^T \mathbf{x}$$

with

$$oldsymbol{lpha} = (K + \lambda I_{\mathcal{N}})^{-1} \mathbf{t}$$
, and  $K = \mathbf{X} \mathbf{X}^{\mathcal{T}}$  Gram matrix

Luca locchi 9. Kernel Methods 6 / 25

### Kernelized linear models

Linear model with linear kernel  $k(\mathbf{x}, \mathbf{x}') = \mathbf{x}^T \mathbf{x}'$ 

$$y(\mathbf{x}; \boldsymbol{\alpha}) = \sum_{n=1}^{N} \alpha_n \mathbf{x}_n^T \mathbf{x}$$

Solution

$$\alpha = (K + \lambda I_N)^{-1} \mathbf{t}$$

Gram matrix

$$K = \begin{bmatrix} \mathbf{x}_1^T \mathbf{x}_1 & \cdots & \mathbf{x}_1^T \mathbf{x}_N \\ \vdots & \ddots & \vdots \\ \mathbf{x}_N^T \mathbf{x}_1 & \cdots & \mathbf{x}_N^T \mathbf{x}_N \end{bmatrix}$$

### Kernelized linear models

Linear model with any kernel k

$$y(\mathbf{x}; \boldsymbol{\alpha}) = \sum_{n=1}^{N} \alpha_n \, k(\mathbf{x}_n, \mathbf{x})$$

Solution

$$\alpha = (K + \lambda I_N)^{-1} \mathbf{t}$$

Gram matrix

$$K = \begin{bmatrix} k(\mathbf{x}_1, \mathbf{x}_1) & \cdots & k(\mathbf{x}_1, \mathbf{x}_N) \\ \vdots & \ddots & \vdots \\ k(\mathbf{x}_N, \mathbf{x}_1) & \cdots & k(\mathbf{x}_N, \mathbf{x}_N) \end{bmatrix}$$

Luca locchi 9. Kernel Methods 8 / 25

### Kernel trick

#### Kernel trick or kernel substitution

If input vector  $\mathbf{x}$  appears in an algorithm only in the form of an inner product  $\mathbf{x}^T \mathbf{x}'$ , replace the inner product with some kernel  $k(\mathbf{x}, \mathbf{x}')$ .

- Can be applied to any x (even infinite size)
- No need to know  $\phi(\mathbf{x})$
- Directly extend many well-known algorithms

Luca locchi

9. Kernel Methods

9 / 25

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### **Kernels**

Extend linear models to non-linear functions. Allow input with variable length or infinite dimensions?

### Examples:

- strings
- trees
- image features
- time-series
- ...

Luca locchi 9. Kernel Methods 10 / 25

### Kernels

### Approach:

use a similarity measure  $k(\mathbf{x}, \mathbf{x}') \geq 0$  between the instances  $\mathbf{x}, \mathbf{x}'$   $k(\mathbf{x}, \mathbf{x}')$  is called a *kernel* function.

Note: If we have  $\phi(\mathbf{x})$  a possible choice is  $k(\mathbf{x}, \mathbf{x}') = \phi(\mathbf{x})^T \phi(\mathbf{x}')$ .

Luca locchi

9. Kernel Methods

11 / 25

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### Kernels

### **Definition**

*Kernel function*: a real-valued function  $k(\mathbf{x}, \mathbf{x}') \in \mathbb{R}$ , for  $\mathbf{x}, \mathbf{x}' \in \mathcal{X}$ , where  $\mathcal{X}$  is some abstract space.

Typically k is:

• symmetric:  $k(\mathbf{x}, \mathbf{x}') = k(\mathbf{x}', \mathbf{x})$ 

• non-negative:  $k(\mathbf{x}, \mathbf{x}') \geq 0$ .

Note: Not strictly required!

Luca locchi 9. Kernel Methods 12 / 25

## Input normalization

Input data in the dataset *D* must be normalized in order for the kernel to be a good *similarity measure* in practice.

Several types of normalizations:

- min-max  $\bar{x} = \frac{x min}{max min}$  min, max: minimum and maximum input values in D
- normalization (standardization)  $\bar{x} = \frac{x-\mu}{\sigma}$   $\mu$  mean and  $\sigma$  standard deviation of input values in D
- unit vector  $\bar{x} = \frac{x}{||x||}$

In the following, we assume the use of normalized input data.

### Kernel families

Linear

$$k(\mathbf{x}, \mathbf{x}') = \mathbf{x}^T \mathbf{x}'$$

**Polynomial** 

$$k(\mathbf{x}, \mathbf{x}') = (\beta \mathbf{x}^T \mathbf{x}' + \gamma)^d, \ d \in \{2, 3, \ldots\}$$

Radial Basis Function (RBF)

$$k(\mathbf{x}, \mathbf{x}') = \exp(-\beta |\mathbf{x} - \mathbf{x}'|^2)$$

**Sigmoid** 

$$k(\mathbf{x}, \mathbf{x}') = \tanh(\beta \mathbf{x}^T \mathbf{x}' + \gamma)$$

Luca locchi 9. Kernel Methods 14 / 25

### Kernelized SVM - classification

In SVM, solution has the form:

$$\mathbf{w}^* = \sum_{n=1}^N \alpha_n \, \mathbf{x}_n$$

Linear model (with linear kernel)

$$y(\mathbf{x}; \boldsymbol{\alpha}) = \operatorname{sign}\left(w_0 + \sum_{n=1}^N \alpha_n \mathbf{x}_n^T \mathbf{x}\right)$$

Kernel trick

$$y(\mathbf{x}; \boldsymbol{\alpha}) = \operatorname{sign}\left(w_0 + \sum_{n=1}^N \alpha_n \, k(\mathbf{x}_n, \mathbf{x})\right)$$

Note:  $w_0$  also estimated from  $\alpha$ 

Luca locchi

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### Kernelized SVM - classification

Lagrangian problem for kernelized SVM classification

$$\tilde{L}(\mathbf{a}) = \sum_{n=1}^{N} a_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} a_n a_m t_n t_m k(\mathbf{x}_n, \mathbf{x}_m)$$

### **Solution**

$$a_n = ...$$

$$w_0 = \frac{1}{|SV|} \sum_{\mathbf{x}_i \in SV} \left( t_i - \sum_{\mathbf{x}_j \in S} a_j t_j k(\mathbf{x}_i, \mathbf{x}_j) \right)$$

Luca locchi 9. Kernel Methods 16 / 25

## Kernelized linear regression

Linear model for regression  $y = \mathbf{w}^T \mathbf{x}$  and data set  $D = \{(\mathbf{x}_n, t_n)_{n=1}^N\}$ Minimize the regularized loss function

$$J(\mathbf{w}) = \sum_{n=1}^{N} E(y_n, t_n) + \lambda ||\mathbf{w}||^2,$$

where  $y_n = \mathbf{w}^T \mathbf{x}_n$ .

Luca locchi

9. Kernel Methods

17 / 25

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# Kernelized linear regression

Apply the kernel trick:

$$y(\mathbf{x}; \mathbf{w}^*) = \sum_{n=1}^{N} \alpha_n k(\mathbf{x}_n, \mathbf{x})$$

$$\alpha = (K + \lambda I_N)^{-1} \mathbf{t}$$

Issue: computation of K requires  $> N^2$  operations and K is not sparse.

Luca locchi 9. Kernel Methods 18 / 25

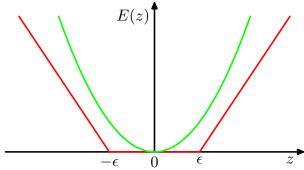

## Kernelized SVM - regression

Consider

$$J(\mathbf{w}) = C \sum_{n=1}^{N} E_{\epsilon}(y_n, t_n) + \frac{1}{2} \|\mathbf{w}\|^2$$

with C inverse of  $\lambda$  and  $E_{\epsilon}$  an  $\epsilon$ -insensitive error function:

$$E_{\epsilon}(y,t) = \begin{cases} 0 & \text{if } |y-t| < \epsilon \\ |y-t| - \epsilon & \text{otherwise} \end{cases}$$

Not differentiable  $\rightarrow$  difficult to solve.

Luca locchi

9. Kernel Methods

19 / 25

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

## Kernelized SVM - regression

Introduce slack variables  $\xi_n^+, \xi_n^- \geq 0$ :

$$t_n \le y_n + \epsilon + \xi_n^+$$
  
$$t_n \ge y_n - \epsilon - \xi_n^-$$

Points inside the  $\epsilon$ -tube  $y_n - \epsilon \le t_n \le y_n + \epsilon \Rightarrow \xi_n = 0$ 

$$\xi_n^+ > 0 \Rightarrow t_n > y_n + \epsilon$$

$$\xi_n^- > 0 \Rightarrow t_n < y_n - \epsilon$$

with 
$$y_n = y(\mathbf{x}_n; \mathbf{w})$$

Luca locchi 9. Kernel Methods 20 / 25

# Kernelized SVM - regression

Loss function can be rewritten as:

$$J(\mathbf{w}) = C \sum_{n=1}^{N} (\xi_n^+ + \xi_n^-) + \frac{1}{2} ||\mathbf{w}||^2,$$

subject to the constraints:

$$t_n \leq y(\mathbf{x}_n; \mathbf{w}) + \epsilon + \xi_n^+$$
  
 $t_n \geq y(\mathbf{x}_n; \mathbf{w}) - \epsilon - \xi_n^-$   
 $\xi_n^+ \geq 0$   
 $\xi_n^- \geq 0$ 

This is a standard quadratic program (QP), can be "easily" solved.

Luca locchi 9. Kernel Methods 21 / 25

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

## Kernelized SVM - regression

Lagrangian problem

$$\tilde{L}(\mathbf{a}, \mathbf{a}') = \dots \sum_{n=1}^{N} \sum_{m=1}^{N} a_n a_m \dots k(\mathbf{x}_n, \mathbf{x}_m) \dots$$

from which we compute  $\hat{a}_n$ ,  $\hat{a}'_m$  (sparse values, most of them are zero) and

$$\hat{w}_0 = t_n - \epsilon - \sum_{m=1}^{N} (\hat{a}_m - \hat{a}'_m) k(\mathbf{x}_n, \mathbf{x}_m)$$

for some data point n such that  $0 < a_n < C$ 

### **Prediction**

$$y(\mathbf{x}) = \sum_{n=1}^{N} (\hat{a}_n - \hat{a}'_n) k(\mathbf{x}, \mathbf{x}_n) + \hat{w}_0$$

Luca locchi 9. Kernel Methods 22 / 25

## Kernelized SVM - regression

From Karush-Kuhn-Tucker (KKT) condition (see Bishop Sect. 7.1.4) **Support vectors** contribute to predictions

$$\hat{a}_n > 0 \Rightarrow \epsilon + \xi_n + y_n - t_n = 0$$

data point lies on or above upper boundary of the  $\epsilon$ -tube

$$\hat{a}'_n > 0 \Rightarrow \epsilon + \xi_n - y_n + t_n = 0$$

data point lies on or below lower boundary of the  $\epsilon$ -tube

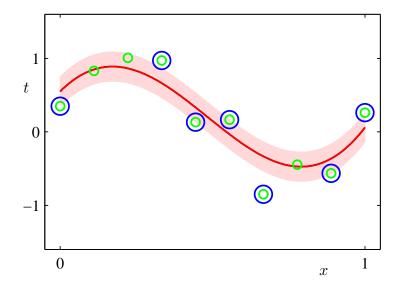

All other data points inside the  $\epsilon$ -tube have  $\hat{a}_n = 0$  and  $\hat{a}'_n = 0$  and thus do not contribute to prediction.

Luca locchi 9. Kernel Methods 23 / 25

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# Kernelized SVM - regression

Example: support vectors and  $\epsilon$  insensitive tube

Luca locchi 9. Kernel Methods 24 / 25

## Summary

- Kernel methods overcome difficulties in defining non-linear models
- Kernelized SVM is one of the most effective ML method for classification and regression
- Still requires model selection and hyper-parameters tuning

Luca locchi 9. Kernel Methods 25 / 25
