# 12. Convolutional Neural Networks

Luca locchi

with contributions from Valsamis Ntouskos

Luca locchi

12. Convolutional Neural Networks

#### Overview

- Convolution
- Convolutional layers
- Pooling
- Example: LeNet
- CNNs for Images
- "Famous" CNNs
- Transfer learning
- Resources

#### References

Ian Goodfellow and Yoshua Bengio and Aaron Courville. Deep Learning - Chapter 9. http://www.deeplearningbook.org

12. Convolutional Neural Networks

3 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### Motivation

Up to now we treated inputs as general feature vectors

In some cases inputs have special structure:

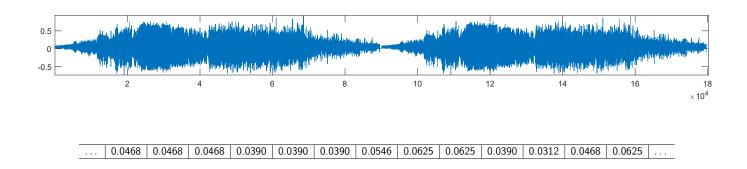

- Audio
- Images
- Videos

Signals: Numerical representations of physical quantities

Deep learning can be directly applied on signals by using suitable operators

### Motivation - Examples

#### **Audio**

Note: variable length 1D vectors (1D tensor)

Luca locchi

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

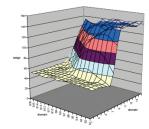

## Motivation - Examples

#### **Images**

45	60	98	127	132	133	137	133
46	65	98	123	126	128	131	133
47	65	96	115	119	123	135	137
47	63	91	107	113	122	138	134
50	59	80	97	110	123	133	134
49	53	68	83	97	113	128	133
50	50	58	70	84	102	116	126
50	50	52	58	69	86	101	120

Note: multi-channel 2D matrices (3D tensor)

#### Video

A sequence of color images sampled through time Note: sequence of multi-channel 2D matrices (4D tensor)

### Convolution

Continuous functions

$$(x * w)(t) \equiv \int_{a=-\infty}^{\infty} x(a) w(t-a) da$$

Discrete functions

$$(x * w)(t) \equiv \sum_{a = -\infty}^{\infty} x(a) w(t - a)$$

Luca locchi

12. Convolutional Neural Networks

7 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### Convolution

Discrete limited 2D functions:

$$(I * K)(i,j) \equiv \sum_{m \in S_1} \sum_{n \in S_2} I(m,n)K(i-m,j-n)$$

 $I: 2D \text{ input, } K: 2D \text{ kernel, } S_i: \text{ finite sets.}$ 

Discrete limited 3D functions:

$$(I * K)(i, j, k) \equiv \sum_{m \in S_1} \sum_{n \in S_2} \sum_{u \in S_3} I(m, n, u) K(i - m, j - n, k - u)$$

 $I: 3D \text{ input, } K: 3D \text{ kernel, } S_i: \text{ finite sets.}$ 

Luca locchi

12. Convolutional Neural Networks

8 / 46

### Convolution

#### Commutative

$$(I * K)(i, j) = (K * I)(i, j) = \sum_{m} \sum_{n} I(i - m, j - n)K(m, n)$$

#### **Cross-correlation**

$$(I*K)(i,j) = \sum_{m} \sum_{n} I(i+m,j+n)K(m,n)$$

implemented in machine learning libraries (called convolution).

Luca locchi

12. Convolutional Neural Networks

## Different types of Convolutions

#### 1D Convolution

Convolution kernel moves in one direction.

#### 2D Convolution

Convolution kernel moves in two directions.

### 3D Convolution

Convolution kernel moves in three directions.

Note: 1D/2D/3D Convolutions does not refer to the dimensions of the input and of the kernel.

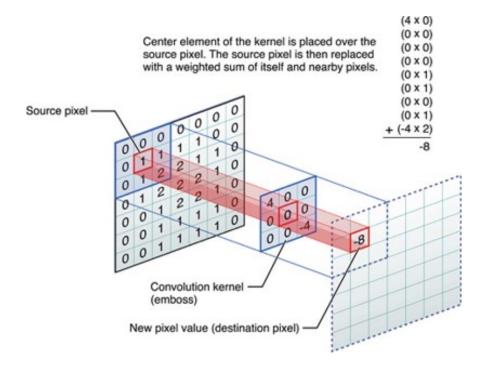

We can have 1D Convolutions for 2D input and kernels, 2D Convolutions for 3D input and kernels, etc.

Luca locchi 12. Convolutional Neural Networks

# **Terminology**

Input size  $(w_{in} \times h_{in} \times d_{in})$  dimensions of the input

**Kernel size**  $(w_k \times h_k \times d_k)$  dimensions of the kernel

Feature map or Depth slice output of convolution between an input and one kernel

**Depth** (d) number of kernels (i.e., of feature maps)

**Padding** (p) nr. of fillers for outer rows/columns (typically zeros)

**Stride** (s) step of sliding kernel (1 does not skip any pixel)

**Receptive field** region in the *input space* that a particular feature is looking at (i.e., is affected by)

# 2D Convolutions with multiple kernels

1 kernel applied to the input produces 1 feature map

#### Examples:

 $32 \times 32 \times 1$  image \*  $5 \times 5 \times 1$  kernel  $\rightarrow 1$  feature map  $28 \times 28$ 

 $32 \times 32 \times 3$  image \*  $5 \times 5 \times 3$  kernel  $\rightarrow 1$  feature map  $28 \times 28$ 

If we use d kernels, we can generate d feature maps (output of depth d)

#### Examples:

 $32 \times 32 \times 1$  image \* 6 kernels  $5 \times 5 \times 1 \rightarrow 6$  feature maps  $28 \times 28$ 

 $32 \times 32 \times 3$  image \* 6 kernels  $5 \times 5 \times 3 \rightarrow 6$  feature maps  $28 \times 28$ 

Note: 6 feature maps  $28 \times 28$  are represented as a  $28 \times 28 \times 6$  tensor.

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# 2D Convolutions with multiple kernels

### In general

Input:  $w_{in} \times h_{in} \times d_{in}$ 

Kernels:  $d_{out}$  of size  $w_k \times h_k \times d_k$  (with  $d_k = d_{in}$ )

Output: feature maps  $w_{out} \times h_{out} \times d_{out}$ 

with  $w_{out}, h_{out}$  computed according to stride and padding (see next slides)

Number of kernel parameters:  $w_k \cdot h_k \cdot d_k \cdot d_{out}$ 

Note: for 3D convolutions  $d_{in} > d_k$  and output with multiple kernels is a 4D tensor  $w_{out} \times h_{out} \times z_{out} \times d_{out}$ , with  $z_{out}$  computed according to slide and padding in the third dimension.

Luca locchi 12. Convolutional Neural Networks

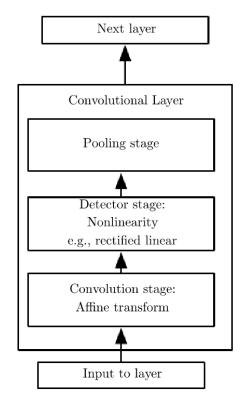

### Convolutional Neural Networks

FNN with one or more convolutional layers.

#### **Convolutional layer**

Three stages:

- convolutions between input and kernel
- non-linear activation function (detector)
- pooling

Luca locchi

12. Convolutional Neural Networks

17 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

## Convolutional layer: Convolution

#### 1. 2D Convolution stage

$$(I * K)(i,j) = \sum_{m} \sum_{n} I(i+m,j+n)K(m,n)$$

Very efficient in terms of memory requirements and generalization accuracy.

- Sparse connectivity
- Parameter sharing

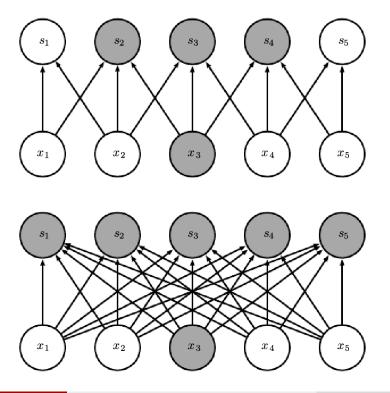

Luca locchi

12. Convolutional Neural Networks

18 / 46

### Sparse connectivity

**sparse interactions/ sparse connectivity**: outputs depend only on a few inputs (as kernel is usually much smaller than input)

Luca locchi

12. Convolutional Neural Networks

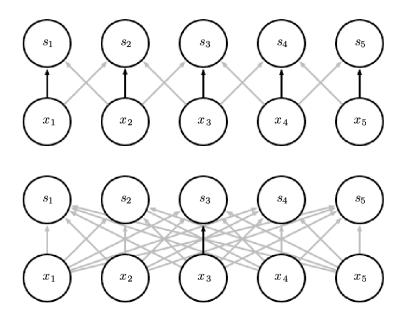

19 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# Parameter sharing

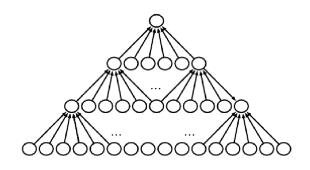

Learn only one set of parameters (for the kernel) shared to all the units.

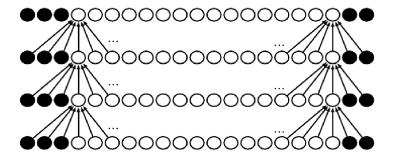

k parameters instead of  $m \times n$  (note:  $k \ll m$ )

## **Padding**

valid padding (p=0): only valid values (output depends on kernel size) same padding  $(p=w_k/2)$ : output has same size of input

Luca locchi

12. Convolutional Neural Networks

21 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

Convolutional layer: Detector

#### 2. Detector stage

Use non-linear activation functions.

- ReLU
- tanh
- ...

## Convolutional layer: Pooling

#### 3. Pooling stage

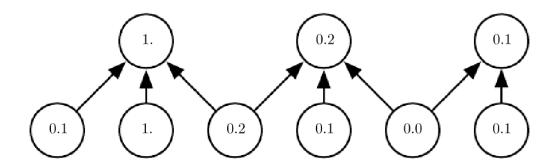

Implements invariance to local translations.

max pooling returns the maximum value in a rectangular region.

average pooling returns the average value in a rectangular region.

When applied with *stride*, it reduces the size of the output layer.

Example: max pooling with width 3 and stride 2

Luca locchi

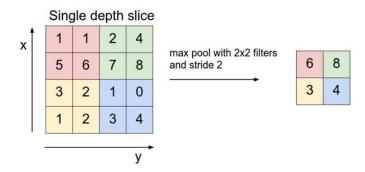

12. Convolutional Neural Networks

23 / 46

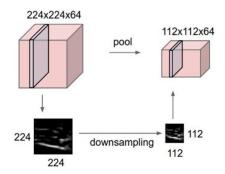

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# Convolutional layer: Pooling

#### Example of max pooling

### Introduces subsampling:

## Feature map size - Number of parameters

Consider input of size  $w_{in} \times h_{in} \times d_{in}$ ,  $d_{out}$  kernels of size  $w_k \times h_k \times d_{in}$ , stride s and padding p

Dimensions of output feature map are given by:

$$w_{out} = \frac{w_{in} - w_k + 2p}{s} + 1$$

$$h_{out} = \frac{h_{in} - h_k + 2p}{s} + 1$$

Number of trainable parameters of the convolutional layer is:

$$|\theta| = \underbrace{w_k \cdot h_k \cdot d_{in} \cdot d_{out}}_{\text{kernel weights}} + \underbrace{d_{out}}_{\text{bias}}$$

# CNNs for Images (2D input)

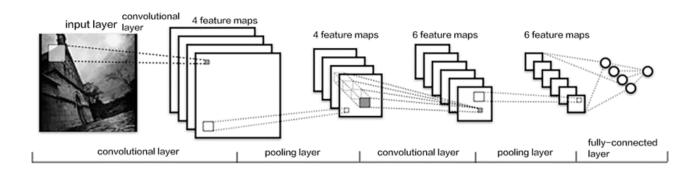

A regular 3-layer Neural Network

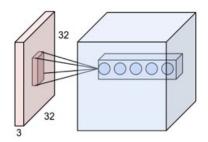

Every convolutional layer of a CNN transforms the 3D input volume to a 3D output volume of neuron activations.

Material from Fei-Fei's group

# CNNs for Images (2D input)

 $w_0$  $w_0x_0$ 

Each neuron is connected to a local 'horizontal' region of the input volume, but to all channels (depth)

The neurons still compute a dot product of their weights with the input followed by a non-linearity

Material from Fei-Fei's group

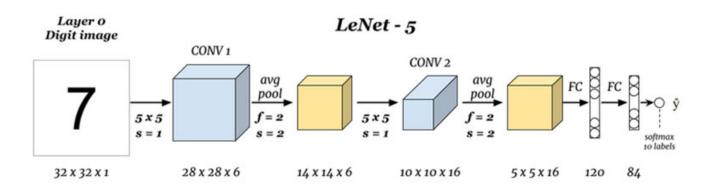

Luca locchi

12. Convolutional Neural Networks

Computed activations during forward pass:

Material from Fei-Fei's group

### Recent success of CNNs

- Theoretical advancements:
  - Dropout
  - ReLUs
  - Batch Normalization
  - Skip connections
  - ...
- Massively Parallel Computing (GPUs/TPUs)
- Very large training sets (ImageNet/MS COCO)
- International competitions (ILSVRC 2010-2017)
- Developing Frameworks (Keras, Theano, Tensorflow, PyTorch, ...)

Luca locchi

12. Convolutional Neural Networks

31 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# ImageNet and ILSVRC

**ImageNet** Huge dataset of images over 14 M labelled high resolution images about 22 K categories

**ILSVRC** Competitions of image classification at large scale (since 2010)

1.2 M images in 1 K categories

5 guesses about image label

http://image-net.org

# "Famous" CNNs

- AlexNet (2012)
- GoogLeNet / Inception (2014)
- VGG (2014)
- ResNet (2015)

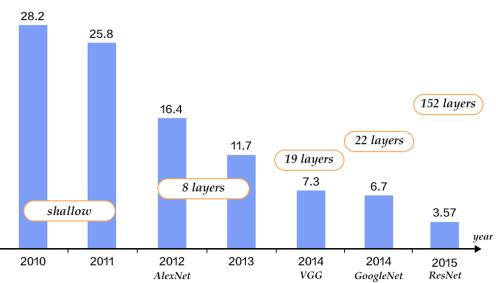

Image top-5 classification error rate on ILSVRC (%)

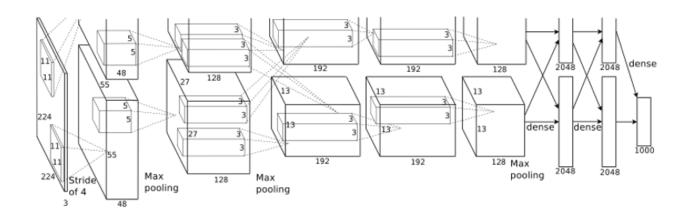

Luca locchi

12. Convolutional Neural Networks

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

## "Famous" CNNs

#### AlexNet - Winner of ILSVRC 2012

- Reached 16.4% top-5 image classification error on ILSVRC 2012
- ullet Large gap from 25.8% top-5 error, best result of ILSVRC 2011
- Not commonly used anymore

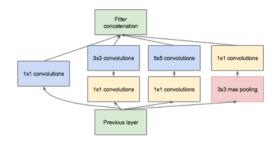

### "Famous" CNNs

### GoogLeNet/Inception - Winner of ILSVRC 2014

#### Inception module:

- Reached 6.7% top-5 image classification error on ILSVRC 2012
- Updated versions commonly used also today (Inception v3 and v4)

Luca locchi

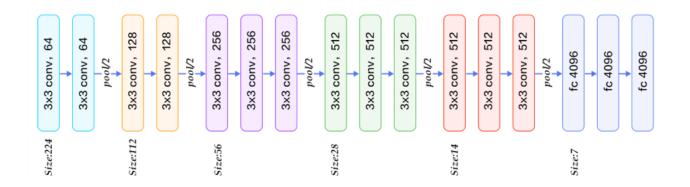

12. Convolutional Neural Networks

35 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# "Famous" CNNs

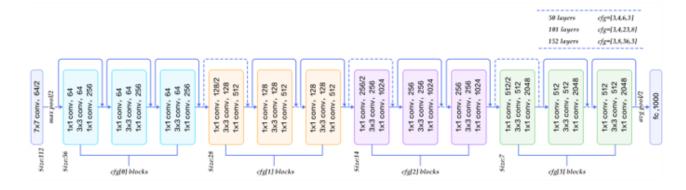

### VGG - 1st Runner-Up of ILSVRC 2014

- Reached 7.3% top-5 image classification error on ILSVRC 2012
- Commonly used also today

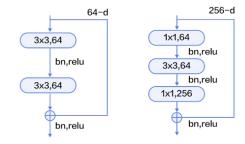

### "Famous" CNNs

### ResNet - Winner of ILSVRC 2015

#### **Residual Layers**

- Reached 3.6% top-5 image classification error on ILSVRC 2012
- Commonly used also today (various versions e.g. 50, 101, 152 layers)

(Use of skip connections)

Luca locchi

12. Convolutional Neural Networks

37 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### Common uses of famous CNNs

- Train a new model on a dataset
- Use pre-trained models (e.g., trained on ImageNet) to
  - predict ImageNet categories for new images
  - extract features to train another model (e.g., SVM)
- Refine pre-trained models on a new dataset (new set of classes)

Examples: https://keras.io/applications/

## Transfer Learning

#### **Definitions**

- D is a domain defined by data points  $\mathbf{x}_i \in \mathbf{X}$  distributed according to  $\mathcal{D}(\mathbf{x})$
- T is a *learning task* defined by labels  $\mathbf{y} \in \mathbf{Y}$ , a target function  $f: \mathbf{X} \to \mathbf{Y}$ , and distribution  $P_{\mathcal{D}}(\mathbf{y}|\mathbf{x})$

#### Given

- ullet  $D_S$  and  $T_S$  a source domain and learning task
- ullet  $D_T$  and  $T_T$  a target domain and learning task
- In general,  $D_S \neq D_T$  and  $T_S \neq T_T$

#### Goal

improve learning of  $f_T: \mathbf{X}_T \to \mathbf{Y}_T$  using knowledge in  $D_S$  and  $T_S$  (i.e., after training  $f_S: \mathbf{X}_S \to \mathbf{Y}_S$ )

Luca locchi

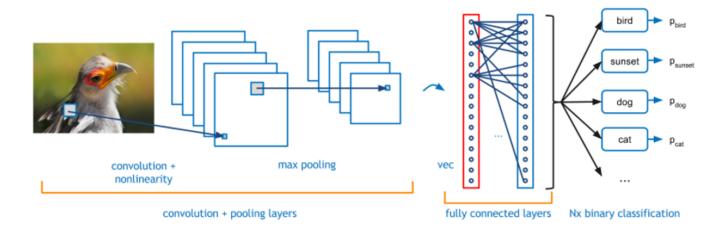

12. Convolutional Neural Networks

39 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# Transfer Learning - Example

### Image classification using a CNN

#### CNN pre-trained on Imagenet

- millions of images (source domain)
- classification of 1000 classes (source learning task)

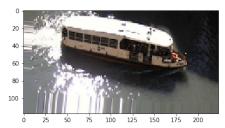

Slide from from Caffe framework tutorial @CVPR2015

# Transfer Learning - Example

### Image classification using a CNN

Use a pre-trained model for a different domain and/or learning task E.g. Boat recognition in ARGOS dataset:

- thousands of boat images (target domain)
- classification of 20 boat classes (target learning task)

Luca locchi

12. Convolutional Neural Networks

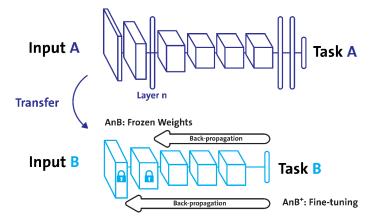

41 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

# Transfer Learning - Example

### 1st solution - Fine-tuning

- use same network architecture with pre-trained model
- network parameters 'copied' from the pre-trained model
- no random initialization

#### **Strategies**

- training of all network parameters
- 'freeze' parameters of some layers (usually the first ones)

Pro Full advantage of the CNN!

Con 'Heavy' training

## Transfer Learning - Example

#### 2nd solution - CNN as feature extractor

- extract features at a specific layer of CNN, usually:
  - last convolutional layer (flattened)
  - dense layers
- 2 collect extracted features  $\mathbf{x}'$  of training/validation split and associate corresponding labels t in a new dataset  $D' = \{(\mathbf{x}'_1, t_1), \dots, (\mathbf{x}'_N, t_n)\}$
- 3 train a new classifier C' using dataset D', e.g.
  - ANN (extreme case of fine-tuning)
  - SVM
  - linear classifier
  - ...
- $oldsymbol{4}$  classify extracted features of test set using the classifier C'

Pro No need to train the CNN!

Con Cannot modify features, source and target domains should be as 'compatible' as possible

Luca locchi

Luca locchi

12. Convolutional Neural Networks

45 / 46

Sapienza University of Rome, Italy - Machine Learning (2022/2023)

### Summary

- CNNs are deep networks using convolution
- Very efficient (memory and generalization accuracy)
- Many successful examples
- Requires very large amount of data and very high computational resources
